this book describes the construction and the properties of cw complexes these spaces are important because firstly they are the correct framework for homotopy theory and secondly most spaces that arise in pure mathematics are of this type the authors discuss the foundations and also developments for example the theory of finite cw complexes cw complexes in relation to the theory of fibrations and milnor's work on spaces of the type of cw complexes they establish very clearly the relationship between cw complexes and the theory of simplicial complexes which is developed in great detail exercises are provided throughout the book some are straightforward others extend the text in a non trivial way for the latter further reference is given for their solution each chapter ends with a section sketching the historical development an appendix gives basic results from topology homology and homotopy theory these features will aid graduate students who can use the work as a course text as a contemporary reference work it will be essential reading for the more specialized workers in algebraic topology and homotopy theory

the authors argument is a spiritual descendent of earlier work of adler and weiss sina and bowen and involves a close study of triangulations the discussion is long and technical but the outline of the proof is sketched clearly in section 1 for the special case of italic f an expanding immersion a concluding section lists problems on hyperbolic sets markov partitions and related matters remarks on topological invariants including the conjectured vanishing of pontryagin classes for manifolds supporting anosov diffeomorphisms may be of particular interest
